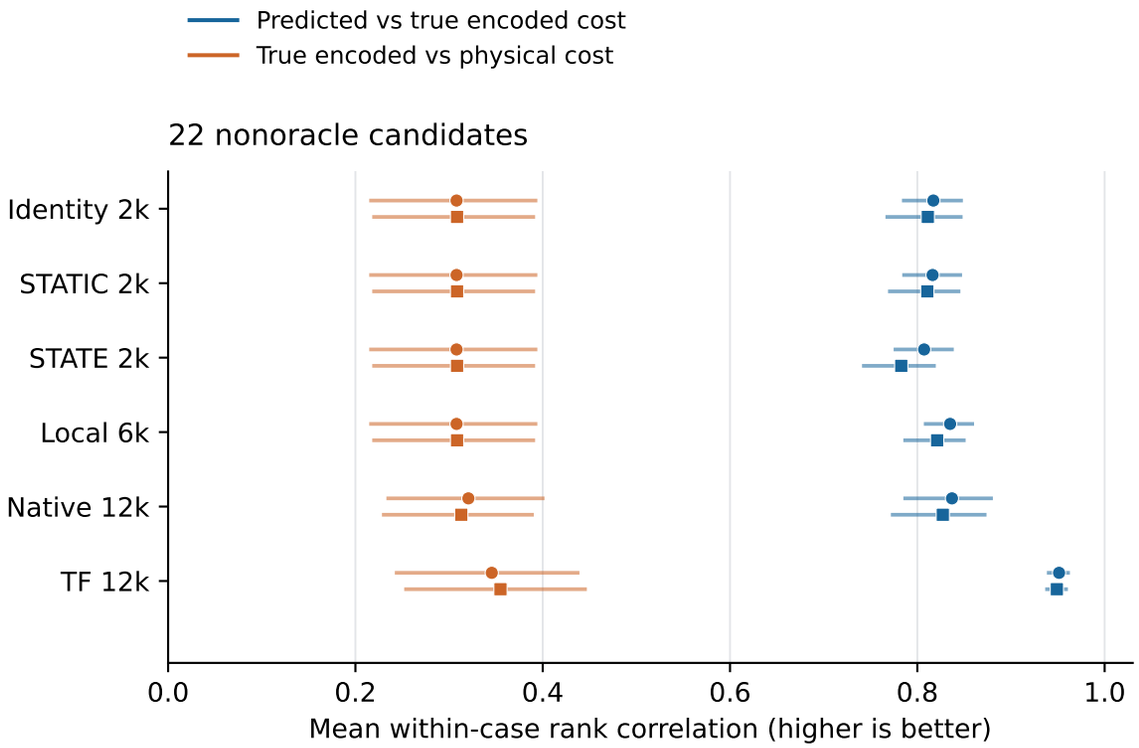
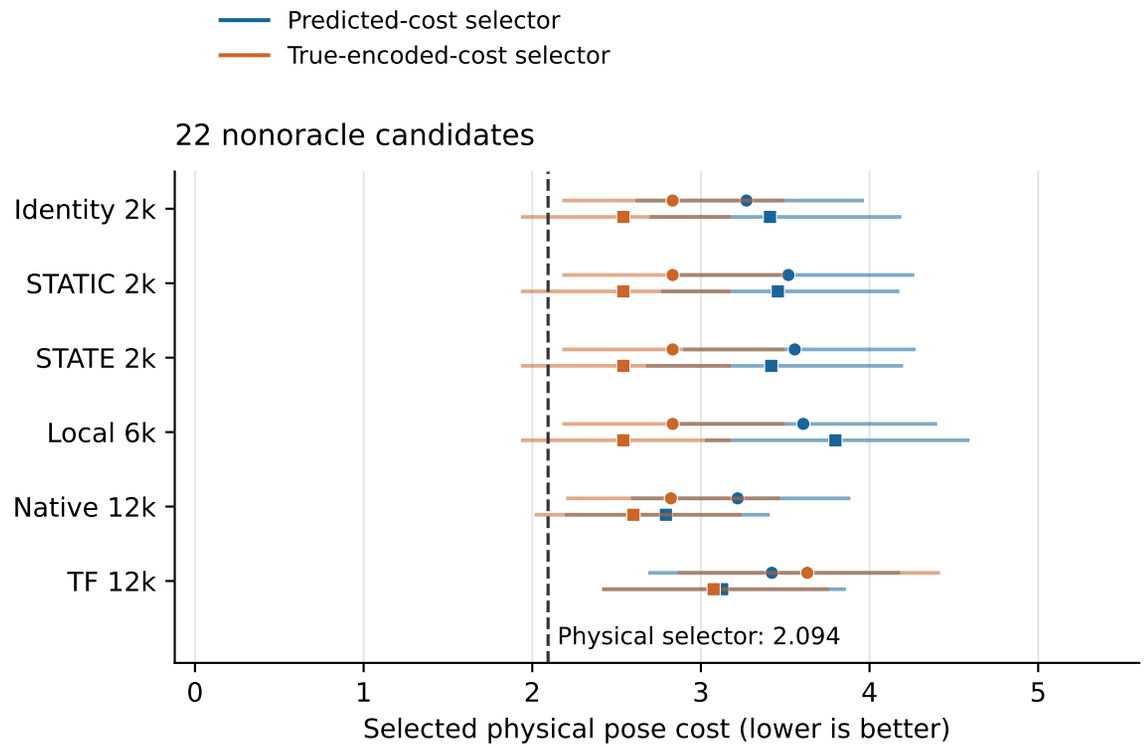
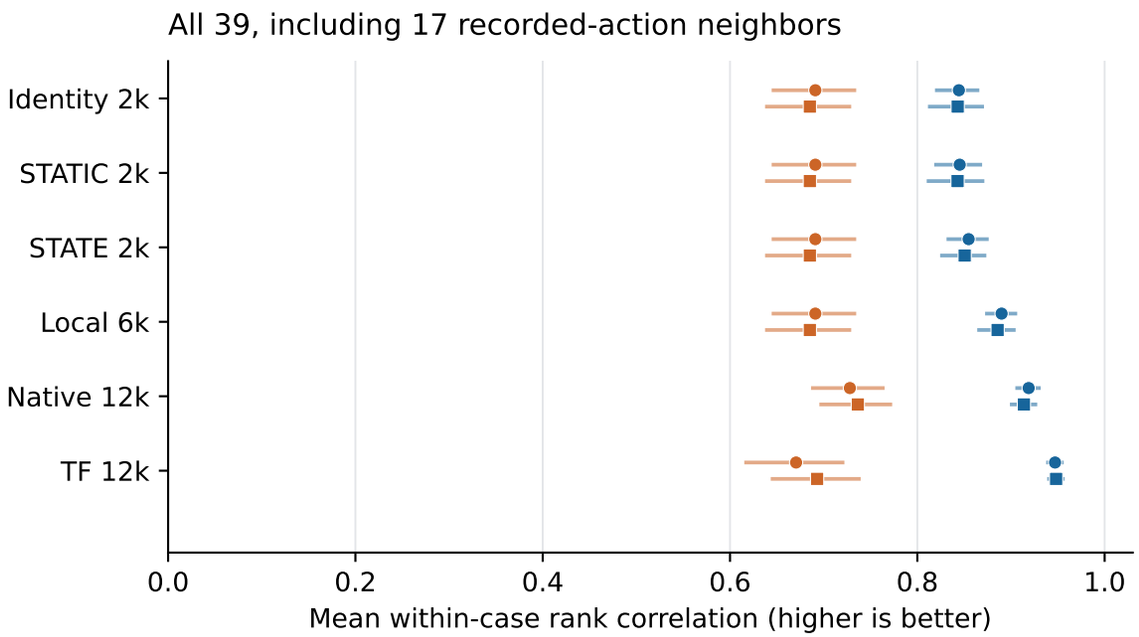
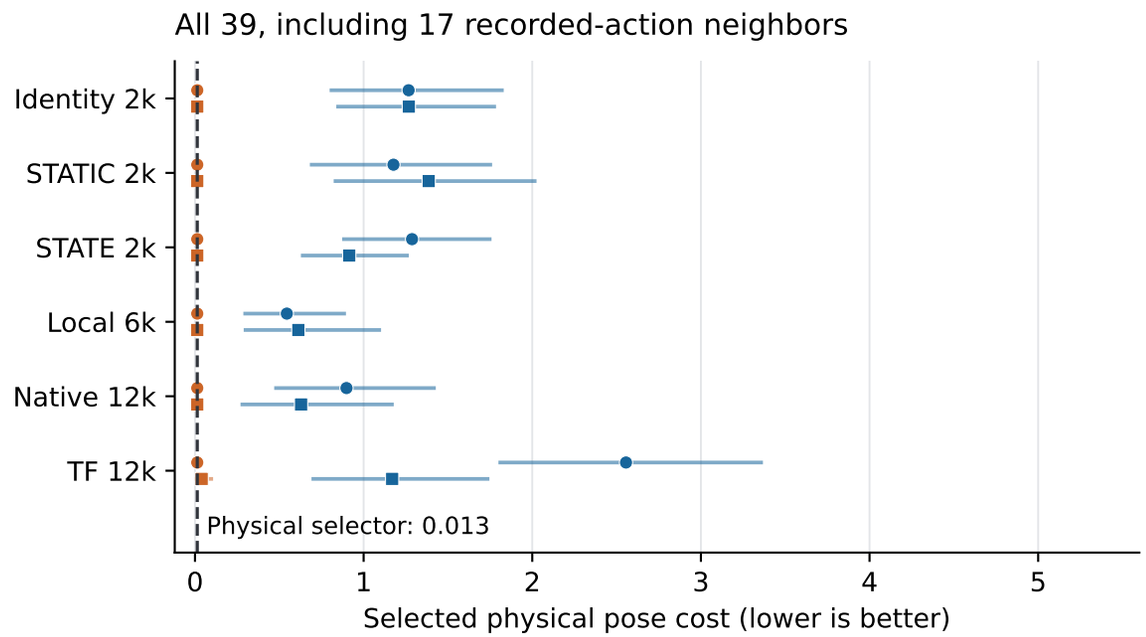
Accurate latent-cost ranking does not ensure a good physical choice

Cube | 50 fixed cases | every model and both seeds | no new simulation or training









Circles: seed 1; squares: seed 2. Bars: case-bootstrap 95% intervals, conditional on these trained models.
Pose cost = max(position error / 3 cm, symmetry-aware angle error / 15 degrees).
An old 25-step candidate bank, not current-model CEM or a 50-step closed-loop benchmark.
